(a) Quality vs. compute (n = 3,000)
ACPL (cp, lower is better)
mean measured cost per move (ms)
10%
25%
50%
75%
laya_only
always_s2
mcts_uniform (ACPL 235, 1042 ms) is off-axis
random gate (expected)
confidence gate
(b) Gate vs. random control, 95% CI
full-search benefit
10% target (10% achieved)
25% target (25% achieved)
50% target (52% achieved)
75% target (76% achieved)
ACPL advantage over matched random gate (cp; > 0 = gate better)
hindsight oracle (post hoc)
confidence gate (frozen)
